                                                                                                                                                g
                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a novel enzymatic nucleic acid (ENA) having a harmmerhead motif (EM) comprising: (i) at least 5 ribose residues (ii) a 2.-(2-allyl modification at position 4 of the ENA; (iii) at least ten 2.-O-methyl modification at position 4 of the ENA; (iii) at least can inhibit collagenase and stromelysin production in the symovial ENA's membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantion of a donor. They can also he used for enhancing graft tolerance or for treating autoimmune disease, and for reating allergies and other inflammercry conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene
                                                                                                                                                                                                               Arthritic condition, graft tolerance, immune response; target; cleavage; hammerhead ribozyme; halfpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation;

genome (represented in AXX10269-XI2937). These primers used in the human genome (represented in AXX10269-XI2937). These primers can be used in a genome (represented in AXX10269-XI2937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, patermity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Addrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary hardomer, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous syndrome, interprity, appearance (e.g. baldness, obesity), strength, speed, endurance fertility, and susceptibility or receptivity to particular drugs or the rapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases
                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAX09121-X10268 are allele-specific oligonucleotide primers used in the
expression which accompany treatment with retinoids and dexamethasone. The concentration of ilbozyme required to affect a therapeutic treatme is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism, biallelic, human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

AAV48709-886 represent antisense oligonuclectides directed against the ErbB-2 gene. Of these, only oligonuclectides AAV48709-91 resulted in significant redcution in ErbB-2 protein expression, while significant redcution in ErbB-2 protein expression, while contain a redcution in ErbB-2.

Significant redcution in ErbB-2 protein expression, while exemplify the invention. The specification describes oligonuclectides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive consecutive cytosines; do not contain two sequences of three consecutive cytosines; and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The consecutions are used to modulate expression of genes, particularly the genes for p53, ErB-2, jumB, jumb, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteochasts, osteochasts and/or keratinocytes). The cligonuclectides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive quancisine or inceine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in

differentially expressed in colorectal cancer, in pancreatic cancer, or differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample euspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                   AAV99282/
                                 A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC a random sequence, and a catalytic admin (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with condounclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or consisting activity that modulate expression of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV99922 to AAV93877 repression of a Raf gene

Oligonucleotides AAV992B1-83 represent modified defibriotide sequences containing a Human immunodeficiency virus (HIV) homology region and a cellular regulatory factor. Defibriotide is a polyanion salt of a cellular regulatory factor. Defibriotide is a polyanion salt of a deoxyribonucleic acid obtained from mammalian tissue. The products can be used for treating disease such as infection, schistosoma infection, preunosoma infection e.g. Candida tropicalis and japonicum, Schistocerca Leishmania infection, Trypansoma infection e.g. Candida tropicalis and candida Ablacians, Aapsergillus infection, Pneumocystis carinii infection, candida Ablacians, Appergillus infection, Pneumocystis carinii infection, candida Ablacians, garam negative bacterial infection, demertic diseases e.g. Duchenne's muscular dystrophy and convins infection, genetic diseases e.g. Duchenne's mystrophy and Down's syndrome, degenerative diseases e.g. Duchenne's mystrophy and convins infection, genetic diseases e.g. Duchenne's mystrophy and convins infection and radiation damage, neoplasia, e.g. lympho-proliferative proximal muscle weakness, Leber's syndrome, retinitis pigmentosa, actaxia, selzures, proximal muscle weakness, Leber's sancer, neurobathy, optic neuroitis, and radiation damage; neoplasia, e.g. lympho-proliferative colon cancer; and skin disease, pancreatic cancer, lung cancer, and colon cancer; seborrheic dermatitis, psoriasis, Reiter's syndrome, insect colon ancer; and skin diseases, e.g. molluscum contegiosum, bacillary cadition a drug resistance can be treated via administering the nucleic cancin components of elibrotide and the variants in combination with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                     Use of defibrotide nucleic acid components - for treating e.g. infectious diseases, genetic diseases, degenerative diseases, DNA damage, neoplasia and skin disease, particularly HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence as screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by viral replication, and are used to treat diseases associated with hepaticis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatoccellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme carget sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified without severe synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the carget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cleavage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a
                                                                                                                                                                                                                                                       The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepztitis of virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves can the pagatists of virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mANA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the carget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosts, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                               Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGTWNNTGGAGT encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ9016-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hemopoletin receptor protein family NR8 used for diagnosis of blood formation disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-Z59925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders

The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGATNNYTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ30816-S0925 sepresent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNINGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZS92S8-Z59300 and AAZ90816-Z90925 represent specific examples of probe sequences used in the search.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hemopoietin receptor protein family NR8 used for diagnosis of blood formation disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGAGACYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-S90925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hemopoietin receptor protein family NR8 used for diagnosis of blood formation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Neocarzinostatin apoprotein synthetic gene useful as a chemotherapy agent
for acute leukemia, bladder cancer and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel neocarzinostatin (NCS) apoprotein synthetic gene (I), apoNCS. The products of the invention can be used as a chemotherapy agent for acute leukemia, bladder cancer and pancreatic cancer. This sequence encodes a fragment of the apoNCS protein described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-Z59925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders
Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present PCR primer was used to detect a polymorphism in the human 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-COA) reductase gene. The polymorphism is present in the promoter region, exon 15, introns 2, 5, 15 or 18. HMG-COA reductase polymorphisms are useful as genetic markers in linkage studies. Detection of the presence of the polymorphisms is useful for assessing the pharmacogenetics of therapeutic compounds in the treatment of HMG-COA reductase mediated diseases. The polymorphisms are
                                                                                                                       The present invention is concerned with the elucidation of the gene cluster from Streptomyces globisporus which regulates enediyne C-1027 synthesis. Enediyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which causes damage to DNA. The primers AAA63353-A63451 were used to isolate the open reading frames which used to produce the protein and to identify antagonists, both of which can be used in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polymorphisms in human 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) gene useful for diagnosis and treatment of HMG-CoA reductase-mediated diseases such as dyslipidemia and other cardiovascular diseases
                                               Isolated nucleic acid comprising a nucleic acid encoding any of C-1027 open reading frames (ORFs) -7 to 42, excluding ORF 9 (cagA), useful for the production of enediyne C-1027 antitumor antibiotics.
                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3-hydroxy-3-methylglutaryl-coenzyme A reductase gene; dyslipidemia;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonuclectide which can be used to design the antisense an oligonuclectide which can be used to design the antisense of psoriasis, cliptures, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, chthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hopping such as a neovascular condition of the retina, brain or skin, growth factor-mediated mallgamancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense therapy, antiproliferative, antiinflammatory; antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor, IGF-1; pityriasis, IGF binding protein, IGFBP-2, IGFBP3; inflammation, psoriasis; pilaris, growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba, keatoosis, neoplasia; scleroderma, wart; skin cancer; sclerotic disease; hyperneovascular condition, hyperplasia, kidney disease; neovascular condition, retina, ss.
useful for diagnosis of HMG-COA reductase mediated diseases such as dyslipidemia and other cardiovascular diseases such as myocardial infarction and stroke. HMG-COA reductase antagonist drugs are used to treat dyslipidemia and other cardiovascular diseases such as myocardial infarction and stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 70; 201pp; English

The present invention relates to a method for ameliorating the effects of antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB], which is capable inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, inchipyosis, pityriasis, pitaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood ressels or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 93; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or inhibiting or reducing growth factor mediated cell proliferation, or inhibiting or reducing growth factor mediated cell proliferation, or information and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF4153-PAS161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborthea, keloids, keratosis, chopsissis, scleroderma, warts, benign growths, cancers of the skin, a neoplasias, scleroderma, warts, benign growths, cancers of the skin, a brain or skin, growth factor-mediated malignandses, other sclerotic brain or skin, growth factor-mediated malignandses, other sclerotic vessels or any other hyperproliferation of the inside of blood vessels or any other hyperplasia

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticense oligonucleotide, (for Insulin-like Growth Factor IngPl-1 creeptor. IGF binding protein [IGFP]-2 or IGFPP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense of postiasis, F45161). The method is useful for ameliorating the effects of psoriasis, nothyosis, pityriasis, ruba, planis, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood creating the second condition of the inside of blood constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

IGF-I oligonucleotide #338.

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleoride, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or contex disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotide which can be used to design the artisense oligonucleotide is useful for ameliorating the effects of psoriasis, chthyosis, pityriasis, rubra, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin discorder, Insulin-like Growth Factor. I receptor; IGF-1, pityriasis, IGF binding proctein, IGFBP-2, IGFBP3, inflammation, psoriasis, pilaris, growth factor mediated cell proliferation; ichthyosis, serborrhoea, ruba, kearcosis, neoplasia, scleroderma, wart, skin cancer; sclerotic disease, hyperneovascular condition, hyperplasis, kidney disease; neovascular condition, hyperplasis, kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.5%; Score 11.8; DB 1; Length 15; 86.7%; Pred. The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - or IGFBPB), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 inchthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic;

```

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleoride, (for Insulin-like Growth Factor [GPF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide is useful for ameliorating the effects of psoriasis, chthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, varts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood to sessels or any other hyperplasia Sequence 15 BP; 2 A; 4 C; 7 G; 2 T; 0 U; 0 Other; Query Match

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [167]-1 receptor, [167 binding protein [167BP]-2 or IGFBP3), which is capable of inhibiting or reducing prowth factor mediated cell proliferation.

In compared to the disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-1545161). The method is useful for ameliorating the effects of psoriasis, cichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, nepplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                      Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
skin cancer; sclerotic disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleoride, (for Insulin-like Growth Factor [GGP]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the affects of psoriasis, FA5161). The method is useful for ameliorating the effects of psoriasis, nothyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the brain or skin, growth factor—mediated malignancies, other sclerotic disease, kidney disease, hyperpooliferation of the inside of blood to essels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                            Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                               Edmondson SR;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGRP-1] receptor, IGF binding protein [IGRBP-2] or IGFBP3), which is capable of inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the ARF45151 and AAF45153- CF F45161). The method is useful for ameliorating the effects of psoriaais, inthipsis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, chhyposis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, chyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood customers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBF3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; kearosis; neophasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition; hyperplasia; kidney disease;

                                                                                                                                                                                                                    Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonucleotides of the present invention (see AFF45151 and AAF45153-
PAF161). The method is useful for ameliorating the effects of postiaais,
ichthyosis, pityriasis, ruba, plaris, serborrhoea, Keloids, keratosis,
neoplasias, scleroderma, warts, benign growths, cancers of the skin, a
hyperneovascular condition such as a neovascular condition of the retina,
brain or skin, growth factor-mediated maliannoides, other sclerotic
disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for ameliorating the effects of
                                                                                                                                                                                                                                                                                                                                                                                                                                  skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding procein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticomplete state of antisease oligonuclectide, (for Insulin-like Growth Factor (IGF)-1 receptor, IGF binding protein [IGFB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inhibiting or other disorders. The present sequence is an information and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisease oligonuclectide which can be used to design the antisease oligonuclectide with a present invention (see AAF45151 and AAF45153-CF45161). The method is useful for ameliorating the effects of psoriasis, chthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hoperneovascular condition such as a neovascular condition fithe retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood cure of the research and provided the inside of blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-Ike Growth Factors [1989-1] receptor, IGF binding protein [IGFBP2] or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which as the present invention (see AAF45151 and AAF45153-F55161). The method is useful for ameliotrating the effects of psortasis, inchipyosis, pityriasis, ruba, planis, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malianancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                vessels or any other hyperplasia

Novel polynucleotide comprising single nucleotide polymorphisms in human interleukin-13 gene is useful for studying expression and function of interleukin-13, as well as diagnosing and treating cancer, inflammatory, and immune disorders.

Claim 15; Page 20; 85pp; English.

The present invention provides the protein, cDNA and genomic sequences of human interleukin-13 [113], and describes the single nucleotide polymorphisms (SNPs) found within the gene, which is found on chromosome 5q31. ILM3 is a pro-inflammatory cytokine thought to be involved in the pathogenesis of asthma and other immune and inflammatory diseases. The ILM3 sequences and the SNPs identified can be used in drug screening, to determine an individual's susceptibility to disease, in forensic and patermity testing, and to identify treatments for cancer, immune and inflammatory diseases, including asthma and diseases characterised by fibrosis. The present sequence is an ILM3 allele-specific oligonucleotide

The present invention describes polymuclectides comprising single nuclectide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2). The polymuclectides may be used in assays to detect and characterise The polymuclectides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schizophrenia, Parkinson's and mycolonus dystonia (MD). This information would be useful for sudying the belological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polympeptides. Therefore it is advantageous to detect polymorphisms in the DRD2 gene and how those of polymorphisms are combined in different copies of the gene. AAP70261 to polymorphisms are combined in different copies of the gene. AAP70305 to AAP70404 represent thuman DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAP70405 to DRD2 polymorphisms which are given in the exemplification of the present copies of the present invention. AAP70431 to AAP70538 represent the present invention of the human DRD2 copymorphisms which are used in examples from the present invention.

Polynucleotides comprising single nucleotide polymorphisms in the hum dopamine receptor D2, useful for detecting mutations associated with, e.g. schizophrenia, Parkinson's and myoclonus dystonia.

receptor-lipha gene (ILAR-alpha, see AAP57718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular ILARalpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular ILARalpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human ILAR-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       relates to polymorphisms of the human interleukin 4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha, see AAF57718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha cisogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha

The present invention relates to a method of coupling visual servoing microscopy with living cell analysis, where cellular image data received from a detection device that monitors cells or subcellular components of the cells, is analysed, and in response to the analysed cellular image data several stimulating devices adapted to stimulate the cells or subcellular components, is automatically actuated. The method is useful concarrying out cell-type specific fluorescence assays that are useful for any types of cells, and allows detection and discrimination between normal, premalignant, malignant and/or multidrug resistant cancer cells obtained from tissue, for establishing a chemotherapeutic regimen that is tailored to an individual patient and/or individual tumour and for screnning large numbers of potential drug, insecticide, herbicide and stream expensed is an peptide nucleic acid (PNA) antisense sequence in medicine, agriculture and biotechnology. The present sequence is an peptide nucleic acid (PNA) antisense sequence
                                                                                                        Coupling visual servoing microscopy technique with living cell analysis involves analyzing image data received from detection device monitoring cells, and automatically actuating stimulating devices to stimulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; intercellular adhesion molecule 2; ICAM2; haplotyping; ss; hanlotyne pair; single nucleotide polymorphism; genotyping; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in intercellular adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         haplotype pair; single nucleotide polymorphism; genotyping; PCR igene therapy; drug screening; anti-HIV; antiinflammatory; probe; human immunodeficiency virus; sequencing primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nandabalan K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide containing polymorphisms in intercellular molecule 2 gene, useful in developing drugs for treating human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ठ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Peatures (AFs) and Alzheimer's Disease-Associated Protein Isoforms (APIs) in cerebrospinal fluid, serum or Associated Protein Isoforms (APIs) in cerebrospinal fluid, serum or Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's severity of Alzheimer's Disease. The relative abundance of the AFs and APIs correlates with the severity of Alzheimer's Disease. The present sequence is a probe that may be used for screening an API
                                                                                                                                                                                                                                                                                                                  Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

gene by using probes optimized to function together in a reverse-hybridization assay.

Claim 2; Page 29; 117pp; English.

```
The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haplotyping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs and a haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype for haplotype pair in a reference population, where a higher haplotype for haplotype pair in a reference population, where a higher haplotype for haplotype pair. ICAM2 and its corresponding DNA are used for studying the expression and function of ICAM2, for use in screening for studying the expression and function of ICAM2, for use in screening for studying the effect of variation on the biological activity of ICAM2. Sequences AAS95562-AAS95419-AAS95442 represent allelences AAS95562-AAS95417 and AAS954419-AAS95442 represent allelences and cDNA sequences and cDNA specific collegoucletic probes, sequencing primers and cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ठ
```

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/I/L, Y181C/I, M184V/I, X188L, G190A/S/R, T215Y/F/D/S/A and/or Ol51M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/I/L, Y181C/I, O151M/L, M184V/I, Y188L, G190A/S/R and/or resistance of mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of sequences and probes which are used in the exemplification of the present

HIV-1 reverse transcriptase mutation detection probe SEQ ID NO:473.

(first entry)

31-JAN-2003

ABZ34231;

mutations associated with anti-HIV drug resistance comprises at least one of the mutations in the HIV reverse transcriptase

SAGE tags of the invention

```
The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at associated with anti-HIV drug resistance in a patient by detecting at 1804/8/R, T215YF/D/S/A and/or O151M/L in the reverse transcriptase (RT) of 5104A/S/R, T215YF/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in virro detection of the mutations K103N/R, V106A/I/L, Y181C/I, O151M/L, M184V/I, Y181C, G190A/S/R and/or C151SY/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of antiviral drug resistance or mutation is associated with anti-HIV drug resistance of viruses containing RT genes. AB234642 represent HIV RT contains and probes which are used in the exemplification of the present

New human nucleic acid containing specific SAGE tags, useful diagnostic markers for cancer, also derived probes.

WPI; 2002-153821/20.

Disclosure; Col 31; 161pp; English.

as

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer

```
The present invention relates to enzymatic nucleic acids which specifically of cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirthosis, liver failure and/or hepatococlular carcinoma. The HCV ribozymes are also useful for treating chertical associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the obtained in electronic format directly from the USPTO web site at sequent was sequence.
                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis, virucide; liver failure, hepatocellular carcinoma; HCV infection, drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New ribozymes targeting RNA derived from hepatitis C virus inhibit vireplication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                               Hepatitis C virus substrate #940 for HCV hammerhead ribozyme #940.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid our ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other frug theraphies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta, cytostatic, interferon gamma, consensus interferon, hepatotropic, antiinflammatory, substrate, hammerhead ribozyme, HH ribozyme, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPIO web site at
                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus substrate #337 for HCV hammerhead ribozyme #337.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hopatocellular carcinoma. The HCV infection in conjunction with one or more a condition associated with HCV infection in conjunction with one or more cher drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma; HCV infection, drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon, hepatotropic, antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or inbozyme is in a harmerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication accolated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more a condition associated with HCV infection in conjunction with one or more citre farge therapies, particularly type I interferon. The present sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence acta for this patent was obtained in electronic format directly from the USPTO web site at

The invention relates to reading microarray devices having addressable electrodes to determine binding between capture probe and target molecule (TM). The method involves providing an array having electrodes and capture molecules, attaching an oxidation/reduction enzymatic molecule or attaching an oxidation/reduction enzymatic molecule or attaching an oxidation/reduction enzymatic molecule or array to create a voltage, and mesaring the voltage. The method is useful for reading microarray devices having addressable electrodes to determine the binding between a capture probe and a target molecule, where the target molecule is selected from DNA, RNA, single-stranded DNA, ribosomal RNA, mitochondrial DNA, cellular receptors, glycosylated membrane bound proteins, non-glycosylated membrane-bound proteins, polypeptides, glycosylated from DNA cantibodies, cellular antigonic determinants, organic molecules, metalions, salt anions and cations, and their combinations. The present sequence represents a Kras sequence used to exemplify an oligonucleotide
                                                                                                                                                                                                                                                Microarray device; electrode; oxidation; reduction; Kras; hybridization;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assaying binding of target and capture molecules on microarray devices, by providing an array having electrodes and capture molecules, and enzymatically catalyzing oxidation/reduction reaction to detect current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention relates to methods for screening or diagnosing Alzheimer's disease (AD) to determine the stage or severity of AD in a subject, to identify subject at risk of developing AD, or to monitor the effect of therapy administered. The methods comprise analysing a test sample of body fluid by 2-dimensional electrophoresis to generate a 2-dimensional array of AD-associated features (AFS). The method alternatively comprises quantitatively detecting in a sample of body fluid from the subject, one or more AD-associated protein isoforms (APIS; ABRS9710-ABRS9184). The present sequence is a probe, used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                           Screening or diagnosing of Alzheimer's disease (AD) determine the stage or severity of AD in a subject, comprises analyzing a test sample of body fluid from the subject by 2-dimensional electrophoresis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     telomerase activity, cel replication, neoplasia, cancer, age-related macular degeneration; Alzheimer's disease, atherosclerosis; telomerase, telomerase inhibitor; immortalised cell; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Telomere length and/or telomerase activity related polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a modified Cry protein (I) that is sensitive to pepsin and comprises at least one additional pepsin cleavage sensitive to pepsin and comprises at least one additional pepsin cleavage site (PCS). Also described: (a) increasing pepsin sensitivity of cry proteins by incorporating at least one extra PCS; (b) polynucleotides (II) that encode (I); (c) chimaric genes (CG) that contain a promoter, (II) and terminator; (d) expression or transformation vector (III) that contains CG; (e) host organism (IV) transformed with (III), also, where the organism is a plant, its parts and seeds; (f) production of (I) by grains (I). (I) has insecticide activity. (I) can be used as insecticides, particularly where expressed in transgenic plants. (I) are sensitive to enzymes in the digestive tract of mammals, so do not persist in the tract (lack of persistence is required by regulatory authorities for use, in foods, of seeds containing Cry proteins). Extra PCS do not insecticidal activity. ABV93460 to ABV93309 and ABB6398 con insecticidal activity. ABV93460 to ABV93309 and ABB6308 con insecticidal activity. ABV93460 to ABV93309 and ABB6308
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New modified Cry protein, useful as insecticide, comprises at least one additional pepsin cleavage site to reduce persistence in mammalian gut.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alzheimer's Disease-associated protein isoform, API, probe, SEQ ID 472.

The invention describes a method use for treating increased rate of proliferation of a cell or extending the ability of a cell to replicate, or treating a disease associated with cell senescence. The method comprises administering an agent to reduce loss of telomere length within the senescing cells. The method is useful for treating a condition associated with an increased rate of proliferation of a cell extending the ability of a cell to replicate, or for treating a cell extending the ability of a cell to replicate, or for treating a disease or condition associated with cell senescence e.g. neoplasia. A second method disclosed in the invention is useful for treating a condition associated with an elevated level of telomerase activity within a cell e.g. cancer. Also disclosed is method useful for diagnosis of a condition associated with an increased rate of proliferation in a cell in an individual e.g. age-related macular degeneration, astrocytes associated with Alzheimer's discloses and endothelial cells associated with atherosclerosis. This sequence represents a polynucleotide used in the study of telomere length
                                                                                                                                                                    Treating condition associated with cell senescence or increased rate of cell proliferation, by administering to cell an agent that derepresses telomerase in the senescing cells or that reduces loss of telomere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell proliferation; cell senescence; telomere length; telomerase activity; cel replication; neoplasia; cancer; age-related macular degeneration; Alzheimer's disease; atherosclerosis; telomerase; telomerase inhibitor; immortalised cell; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Telomere length and/or telomerase activity related polynucleotide #63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.5%; Score 11.8; DB 1; Length 15; 86.7%; Pred. The invention describes a method use for treating increased rate of proliferation of a cell or extending the ability of a cell to replicate, or treating a disease associated with cell senescence. The method comprises administering an agent to reduce loss of telomers length within comprises administering an agent to reduce loss of telomers length within associated with an increased rate of proliferation of a cell extending condition associated with an increased rate of proliferation of a cell extending to condition associated with cell senescence e.g. neoplasia. A second method disclosed in the invention is useful for treating a condition associated with an elevated level of telomerase activity within a cell e.g. cancer. CC with an increased rate of proliferation in a cell in an individual e.g. age-related macular degeneration, astrocytes associated with Alzheimer's cc disease and endothelial cells associated with atherosclerosis. This sequence represents a polymucleotide used in the study of telomere length cc and telomerase activity described in the invention
                                                                                                                                                     Treating condition associated with cell senescence or increased rate of cell proliferation, by administering to cell an agent that derepresses telomerase in the senescing cells or that reduces loss of telomere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Microarray; capture probe molecule; target molecule; electrode; oxidation/reduction enzymatic moiety; voltage signal; porous reaction layer; polymeric; lateral signal; laccase; horseradish peroxidase; beta-galactosidase; glucose oxidase; alkaline phosphatase; dehydrogenase; biotin; streptavidin; ss.

The invention discloses a method for reading microarray devices having addressable electrodes to determine binding between a capture probe addressable electrodes to determine binding between a capture probe molecule (CM) and a target molecule. The method comprises providing an molecule (CM) and a target molecule. The method comprises providing an corresponding to the electrodes, non-specifically attaching an coxidation/reduction enzymatic moiety none or multiple daministering the prespect tample to the atray and allowing for binding of the target molecule to CM, adding a substrate to the array that will create a local voltage signal when catalysed by the oxidation/reduction enzyme through local generation of electrochemical reagents and measuring for the presence or absence of a voltage signal generated locally by electrochemical reagents at each electrode having a capture molecule trached to it. The array further comprises a porous reaction layer, made thickness of 0.1-10 microns and functions to block diffusion of oxidation expected to it. The array further comprises a porous reaction layer has a captucion activity products such that there is little lateral signal reduction activity products such that there is little lateral signal compliance oxidase, alkaline phosphatase, dehydrogenases and their combinations, and is attached to the target molecule is combinations, and is attached to the target molecule is combination of oxidation or the capture molecule is chosen from oligonucleotides, polypeptides, and mixed molecules such that middle combinations and is attached to the target molecule is combinativy of the above mentioned molecules. The method is useful for plurality of the above mentioned molecules. The method is useful for traget molecules, and mixed molecules and mixed molecules of plurality of the above mentioned molecules. The method is useful for plurality of the above mentioned molecules, material ones, salt anions, cations or their combinations. The sequence presented is the kraget molecules actio
                                                                                                    Reading a microarray devices comprises providing an array, attaching an oxidation/reduction enzyme to a target molecule, applying the target molecule and an enzyme substrate to the array, and measuring a voltage
                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 1; 26pp; English

Triplex forming oligonucleotide directed against Erb-B2 gene. (revised)
(first entry)

Exb-B2; upstream region; regulatory element; gene expression; triplex; antisense; inhibition; screening; identification; cancer; breast cancer; carcinoma; breast cancer; erythroleukaemia; sarcoma; ss.

synthetic.

The Erb-B2 gene has a purine rich segment with substantial mirror symmetry. This sequence, derived from the Erb-B2 gene is located 69 mucleotides upstraem of the transcriptional start site and is the potential site of H-DMA formation. The overexpression of Erb-B2 is particularly associated with breast cancer. This triplex forming oligonucleotide directed against Erb-B2 and its derivatives may be used in the treatment of breast cancer, erythroleukaemia and sarcoma and more generally any disease involving the expression of Erb-B2. (Updated on 25-MAR-2003 to correct PN field.) Gaps . Composition for decreasing gene transcription - comprises oligo:nucleotide or deriv. complementary to target gene region. 0.5%; Score 11.8; DB 1; Length 16; 16.7%; Pred. This invention describes a novel method for identifying organisms by comparative genetic analysis which comprises polymerase chain reaction (PCR) amplification and subsequent genotyping and analysis of coding and/or non-coding regions, and/or functionally significant regions of highly conserved genes and/or their homologs, and/or their coDNA copies and/or their pseudogenes. The method is used for identifying animals and plants and their relatedness (phylogenetic analysis) and identifying provides rapid, simple and reproducible determination of the sequence provides rapid, simple and reproducible determination of the sequence within a selected gene region. It amplifies sequences from a wade variety of species, producing an amplicon that includes a region with high divergence between species. Since the region amplified is relatively small, even badly degraded DNA can be analysed
                                                                                                                                ng organisms by comparative genetic analysis, useful e.g. in forensic testing, comprises genotyping regions of highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiotensin-converting enzyme gene; ACB; polymorphism; polymorphic marker; cardiovascular disease; myocardial infarction; unstable angina; hypertension; atherosclerosis; stroke; prognosis; drug screening; treatment outcome; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human angiotensin-converting enzyme (ACE) PCR primer, SEQ ID NO:9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assessing cardiovascular status in humans involves comparing test polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for identifying organisms by comparative genetic analysis which comprises polymerase chain reaction (PCR) amplification and subsequent genotyping and analysis of coding and/or non-coding regions, and/or functionally significant regions of highly conserved genes and/or their homologs, and/or their conserved genes and/or their homologs, and/or their collaboration of method is used for identifying animals and plants and their relatedness (phylogenetic analysis) and identifying provides rapid, simple and reproducible determination of the sequence provides rapid, simple and reproducible determination of the sequence within a selected gene region. It amplifies sequences from a wide variety of species, producing an amplicon that includes a region with high divergence between species. Since the region amplified is relatively small, even badly degraded DNA can be analysed
                                                                                                                                                                                                                                                                                                                                                                                       Identifying organisms by comparative genetic analysis, useful e.g. in foods and forensic testing, comprises genotyping regions of highly

The invention relates to a novel method of assessing the cardiovascular catatus in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACE), angiotensin of a tatus in an individual and type 2 (ATE), angiotensingen (AGT), renin, addosterone synthase, endothelin receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one pattern of polymorphic positions within these genes, and comparing the pattern obtained from a population of individual schibiting a predetermined cardiovascular disease status. The polymorphic predetermined cardiovascular disease status is a predetermined cardiovascular disease status of a patient given a predetermined cardiovascular status of a patient given a predetermined cardiovascular status of a patient given a predetermined cardiovascular status of a patient given a predetermine comprising administration of cardiovascular drugs cardiovascular status of a patient regimen comprising administration of cardiovascular and process or cardiovascular status of cardiovascular drugs (e.g., ACE inhibitors, beta-adrenergic receptor antagonists (beta-blockers) or calcium channel blockers). One or more polymorphic markers blockers or antagonists for predicting the outcome of atteatment regimen. Fragments of the genes comprising administration of atteatment regimen. Fragments of primary arrays for high hroughput screening. The polymorphic pattern reduces or individual cardiovascular patient. It also provides the ability to climinates trial and error in adverse response, to a particular calminates trial and error in adverse response, to a particular calminates patients from clinical trials who are predicted to a particular calminates patients from clinical trials who are predicted to a particular correlated with a sub-populations from the treatment group. Beneficial or cartalated with a sub-populations from the reatment group. Beneficial correlated with a sub-population of the test population, because the Example 1; Page 48; 126pp; English. %X656666666666666666666666666666666666888

Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease diagnosis.

Claim 8; Page 56; 83pp; Japanese.

The present invention describes a method for distinguishing a human leukocyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtitre plate wells which are hybridisable specifically with the base sequence of at least one specific mh.A-A. -B or -C allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is sumple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. AAA666943 to AAA67072 represent oligonucleotide probes and PCR primers for use in the method of the present invention

                                                                                    The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AAG61201-C61371 were all used to demonstrate the

```
The invention relates to a non-naturally occurring gene therapy vector, comprising an inner shell having a core complex containing a nucleic acid and at least one complex forming reagent. The vectors are stable having an improved outer steric layer that provides enhanced target specificity, in vivo and colloidal stability. The vectors are relatively homogeneous and comprise chemically defined species. The vectors demonstrate improved cell entry and intracellular trafficking, permitting enhanced nucleic sit that of a peptide nucleic as that of a peptide nucleic acid therapeutic activity such as gene expression. The present sequence is that of a peptide nucleic acid. The present sequence is linked to the SV40 large T-antigen NLS sequence (AAM51435)
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                               Non-naturally occurring gene therapy vector useful for gene therapy, comprises an inner shell having a core complex containing a nucleic acid and at least one complex forming reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining sequence variation in, or monitoring expression of genes in target nucleic acid for high-throughput genotyping of (un)known polymorphisms/mutations, comprises hybridization pattern differences
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a method of simultaneously determining the presence of 2 or more sequence variations in target nucleic acids, or simultaneously monitoring expression of 2 or more genes. The method comprises determining differences in hybridisation between the target nucleic acid and immobilised probes, where differences in hybridisation between the target nucleic acid and immobilised probes, where differences in hybridisation between indicates sequence variations or transcription levels. The method is used for simultaneously determining the presence or absence of two or more sequence variations in target nucleic acids or simultaneously more sequence variations in target nucleic acids or simultaneously money application of two or more genes in target nucleic acids. The method are applicable to high-throughput genotyping of known and unknown polymorphisms and mutations. The method maximises the information yield of hybridisation-based array applications by increasing the number of informative array-immobilised polymucleotide probes. The present sequence represents N-acetyltransferase 2 (NAMI2) G191A single nucleotide probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP'S) which may be used as markers for disease usceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are used in gene therapy. Preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obserity, or inflammatory bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific oligonucleotide probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated gene 216 nucleic acids, useful for diagnosing, preventing or treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 16 BP; 1 A; 1 C; 10 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 11.8; DB 1;

The invention comprises the amino acid and coding sequence of a rhesus monkey (Macaca mulatta) P-glycoprotein and related P-glycoproteins. The DNA and protein sequences of the invention are useful in assays for evaluating the bioavailability of drugs, as well as the optimisation or discovery of drugs for the treatment of disease associated with P-glycoprotein transporter activity. The present DNA sequence represents part of the gene encoding the Rhesus monkey P-glycoprotein

The present invention relates to a method (MI) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject The method comprises detecting in a target nuclaic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA (Urokhase plasminogen activator), SNGG (gamma-symuclein), IDE (insulindegrading enzyme), KNSLI (Kinesin-like protein 1), ILPA (lysosomal acid lypase), and TNPRSF6 (Tumour Necrosis Factor Receptor-SF6), where the polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. MI is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly Alzheimer's disease. The present sequence is a PCR primer, which was used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic regions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to treating viral infection or reactivation comprising contacting an individual with an antagonist of the interaction between a Herpes Simplex virus (HSV) polymolectide sequence appearing as ADD07153 and interferon regulatory factor—1 (HRF-1, a transcription factor of the interferon regulatory pathway). Also included are an isolated HSV polymolectide comprising a HSV polymolectide comprising a HSV polymolectide involved in viral infection or reactivation, correcting computed compounds capable of inhibiting specific binding of IRF-1 to a polymuclectide, screening for compounds capable of inhibiting specific binding of IRF-1 to IRF-1:HRF-BP (Undefined) complex, a compound capable of agonising or antagonishing any compound in IRF-1 and/or interferon or genetic regulatory pathway and a composition for comprising an HSV IRF-1 binding site consensus sequence. The method is useful for treating infections and for cytomegalovirus, Epstein. Barr virus and zoster virus infection. The HSV polymeptide and polymucleotides may also be useful as IPF-1 binding site of the infection or reactivation caused by Harpes virus, e.g., HSV-1 or HSV-2 infections. The HSV polymeptide and polymucleotides may also be useful as IPF-1 binding site of the infection or reactivation send composition and doster virus infection. The HSV polymeptide and polymucleotides may also be useful as IPF-1 binding site of the infection or reactive infections and doster virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating infection or reactivation caused by Herpes virus comprises using antagonist of Herpes Simplex virus polynucleotide sequence and interferon regulatory factor-1.

```

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can labo be used to screen for their specific interactive molecules, the nucleotides can be used for diagnosis or containing the vectors or their specific interactive molecules.

(AEOM-) AEOMICA INC

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure; SEQ ID NO 8355; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP add/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing the concentration and/or amount supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and and skeletal muscle discreters an oligomer used in the screening of the horsent sequence represents an oligomer used in the screening of the horsent energy in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 1691.2 and MDZ12 is encoded at chromosome corrections of manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12, county of MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a novel isolated 17 mer nucleic acid sequence, containing at least 15 consecutive nucleotides from the 17 mer sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one coids of the invention are useful as probes and primers for detecting, identifying action of recombinant polypeptides. Any of the nucleic acids, production of recombinant polypeptides. Any of the nucleic acids, production of paramaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases. The polypeptides can also be used to generate antibodies and antibodies are useful as components of these contents. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression can be used the unant fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, i
designed to detect single-nucleotide polymorphisms and cytosine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAV10702-V10719 are primers used in a method to identify the novel human becast cancer gene CH1-2 by differential display. The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen dispnostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH0010-ABH99998 and ABI0010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at

This sequence represents a PCR primer for the FWR1 gene. This sequence was used to amplify Fragile XA related alleles from the FWR1 gene. The invention relates to a method for characterising a GC rich region of a nucleic acid comprising contacting the nucleic acid with an agent that modifies C or G into residues complementary to A or T, amplifying (at least part of) the resultant modified nucleic acid, and determining the size of the amplification product. The methods and kits for carrying to the methods are useful for characterising GC rich nucleic acids. This is particularly useful for diagnosing trinucleotide repeats associated with regions (FRAXB), spinal and bulbar muscular atrophy (SMBA), myotonic dystrophy (DM), Huntington's disease (HD), spinal and pulbar muscular atrophy (SMBA), myotonic dystrophy (DM), Huntington's disease (HD), spinal and contaction (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE-KR) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE) and cataxia type 1 (SCA1), fragile XE mental retardation (FRAXE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Characterizing GC rich regions of a nucleic acid comprising modifying GC residues into residues complementary to A or T, and amplifying the modified product, useful for diagnosing trinucleotide repeats.
Huntington's disease; DM; HD; spinocerebellar ataxia type 1;

                                                                                                                                                                                                                                                                            Human; single nucleotide polymorphism; SNP; RANGAPI; haplotyping chromosome 22q13.2-q13.31; Ran GTPase activating protein 1; genotyping; cancer; irregular cell cycle associated disorder; ASO; probe; ss; allele-specific oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human Ran GTPase activating protein 1 (RANGAPI) gene (GNPs) in the human Ran GTPase activating protein 1 (RANGAPI) gene denotyping the RANGAPI gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or polymorphisms. The polymucleotides for detecting the RANGAPI gene treatment of diseases associated with RANGAPI activity, such as cancer and other disorders associated with RANGAPI activity, such as cancer AASI9742 represent ASO probes for detecting human RANGAPI gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer; FWR1 gene; fragile XA related allele; GC rich region; FRAXA; diagnosis; trinucleotide repeat; Fragile XA syndrome; FRAXE-MR; SMBA; spinal and bulbar muscular atrophy; myotonic dystrophy; DRAPLA; SCAl;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genotyping human Ran GTPase activating protein 1 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·

cc zinc finger), jjAZ1 (joined with jAZF1) or jAZF1/jjAZ1 polypeptide. The methods of the invention can be used to identify a compound which controls proliferation of endometrial stroma, by expressing jjAZ in the presence of the compound, and determining whether the compound affects expression of jjAZ. jAZFN, jjAZ1 or jAZF1/jjAZ1 polypeptides are useful cexpression of jjAZ. jAZFN, jjAZ1 or raise or test anti-jAZF1, jjAZ1 or to jAZF1/jjAZ1 antibodies. The invention can be used as bait proteins in a cup whybrid assay or three hybrid assay to identify other proteins in a cup or interact with jAZF1/jjAZ1-binding proteins. jAZF1, jjAZ1 or can built and assay or identify other proteins which can tumour marker protein to verify that a stromal tumour is from a tumour marker protein to verify that a stromal tumour is from cor pregnancy, and also for treating endometrial stromal tumours. The coresent nucleic acid sequence represents a PCR primer that was used in the methods of the invention for amplification of the human jAZF1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel fusion protein comprises 2 dimer forming co-expressed amino acid sequences, each consisting of a homodimeric or heterodimeric receptor chain or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a submint of a heterodimeric protein hormone capable of forming a heterodimer with the hormone's other submits. The fusion protein, e.g. the thrombopoietin (TPO)/human chorionic gonadotrophin (hCG) fusion protein encoded by the fusion gene amplified by the present sequence, significantly increases the biological activity of the hormone component, reducing the requirement for hormone itself and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fusion protein; thrombopoietin; TPO; human chorionic gonadotrophin; hCG; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybrid dimeric protein comprising two co-expressed units - each based or receptor or ligand and a subunit of a heterodimeric hormone, especially FSH, for inducing follicular maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 11.6; DB 1; Length 20; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to growth hormone 1 (GH-1) gene including single nucleotide polymorphisms (SNP). The GH-1 diagnostic polymucleotide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included in any complete or partial genetic map of the human genome. GH-1 mutant polypeptides are useful as antagonists of GH-1 hormone action. Polymucleotides encoding these polypeptides are useful in gene therapy. The present sequence is a PCR primer used for amplifying human GH-1 gene
                                                                                                                                                                                                                                                              New growth hormone 1 (GH-1) diagnostic polynucleotide, useful as markers for the analysis of a disease, or of susceptibility to drug treatment for GH-1 dysfunction or other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, jAZF1, juxtaposed with another zinc finger, jjAZ1, jAZF1/jjAZ1, joined with jAZF1, proliferation, endometrial stroma tumour, immunogen, antigen, antibody, fertility, pregnancy, gene therapy, vaccine, PCR,

This invention describes novel homogeneous insoluble proteins (I), their (in) soluble fragments (Ia) and their salts that can bind tumour necrosis factor (TWP). The products of the invention have anti-inflammatory and antimalarial activity. (I) and (Ia) are used (I) to treat diseases in which TNF is involved (e.g. septic shock, autoimmus glomerulonephritis, cerebral malaria, immune responses and inflammation), (Ii) to purify TNF, (iii) to identify TNF (ant) agonists and (iv) for diagnostic determination of TNF in body fluids. Antibodies raised against (I) are used for affinity purification of (I). This sequence represents a PCR primer used in the amplification of the TNF binding protein of the invention. The course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula control or into the core protein a stabilising polypeptide of formula cand X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a mulleic acid encoding a stabilising polypeptide can be linked onto or inserted into a mucleic acid encoding polypeptide can be linked onto or inserted into a mucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoimmune is laborate, or an interreductase protein which can activate nitro drugs in disease, can diffiammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in canyamprofunding therefore or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging. (Updated on 27-AUG-2003 to correct OS field.)

Loetscher H;

WPI; 2001-559312/63

New homogeneous, insoluble proteins that bind tumor necrosis factor (TNF), useful for treating TNF-mediated disorders, e.g. inflammation.

Example 11; Page 16; 26pp; German.

This invention describes novel insoluble proteins (1), also their (in) soluble fragments and pharmaceutically acceptable salts, able to bind tumor necrosis factor (TNF) and in homogeneous form. The products of the invention have antiinflammatory, immunosuppressive, antibacterial, antiprotozoal activity. (1), and related recombinant proteins, are used set in the adiseases mediated by TNF, e.g. shock in cases of meningococcal sepsis, development of autoimmune glomerulonephritis and cerebral malaria. Also (1), or antibodies specific for them, are used for diagnostic determination of TNF in body fluids, for affinity purification of TNF and for identifying (ant) agonists of TNF. This sequence represents a PCR primer used in the amplification of the human 55 kD TNFRP described in the method of the invention

New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding multiple drug resistance. with

(RIBO-) RIBOZYME PHARM INC

Draper KG;

Thompson JD,

WPI; 1993-386203/48.

Claim 3; Fig 10; 69pp; English.

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous consociated with development or maintenance of chronic myelogenous consociated (CML), promyelocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular arctinoma, meuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are clarectly linked to a leukemic phenotype. These target sequences are contained motif, but may also be formed in the motif of a hairpin, heapatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes con a used to inhibit the development or expression of a transformed in phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic corresponding cesistance (mdr-1) mRNA specific ribozymes remove the mechanism of drug resistance (mdr-1) mRNA specific ribozymes remove the cancel drift and mutations within cells. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                             엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to polymucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia.

Condenocarcinoma of breast, prostate or colon, mixed cell leukaemia.

Consecution of telomerase mediated conditions (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polymucleotide inhibitors may also be used in tenatment of tumour. The polymucleotide inhibitors may also be used in adiagnostic assays for detecting RNA or DNA. Inhibition of telomerase and other disorders involving inappropriate activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate diseases. Inhibition of telomerase in haematopoietic stem cells is useful for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human telomerase polymucleotide inhibitor #2, as described in the method of the

The invention relates to novel immunogenic CpG oligodeoxymucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5.NNNT-CpG-WNNN-3' or 5'-RY-CpG-RY -3'. The central CpG motif is unmerthylated, and the oligonucleotides optionally have phosphorothioate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cellmediated response or a humoral (B-cell, antibody) response, with oligonucleotides of the sequence 5'-RY-CpG-RY-3' being able to induce a humoral response it is thought that after administration, the oligonucleotide acts on antigen-presenting cells celling to activation of natural Ailler (NK) cells. A cell-mediated or humoral response can then occur by activation of T- or B-cells. The humoral response can then occur by activation of T- or B-cells. The induction of an immune response is useful for treating, preventing or meliorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonucleotide is administered either alone or
                                                                                                                  Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.
                                                                                                                                                                                                                                                                                                                                                              Claim 4; Page 39; 46pp; English.

The allergic conditions which may be treated include eczema, allergic conditions which may be treated include eczema, allergic conditions, and the infections which may be treated include eczema, allergic conditions, and the infections which may be treated include viral, bacterial, fungal and protozoal infections such as tuberculosis. AlDS, bacterial, fungal and protozoal infections such as tuberculosis. AlDS, used in the treatment of an autoimmune disorder (e.g., lupus erythematosus, rheumatoid arthritis and multiple sclerosis), a disease associated with immune system deficiency, and symptomic CpG associated with immune system deficiency, and symptomic CpG cligonucleotide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonucleotide is preferably administered to the host. The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide SEQ ID NO 25860 for detecting SNP TSC0006595.

SNP; single nuclectide polymorphism; human; diagnosis; FNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic. Set of oligonucleotides, useful for diagnosis and cell typing, : designed to detect single-nucleotide polymorphisms and cytosine Berlin K; 06-APR-2001; 2001WO-IB000713. 07-APR-2000; 2000DE-01019173 ບັ Piepenbrock WPI; 2001-657177/75. Olek A,

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC000 Claim 1; SEQ ID NO 25860; 29pp + Sequence Listing; German. designed to detect methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABF00010-ABF9989 and ABI00010-ABF82073 represent the oligomers described in the invention. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE9989, ABF0010-ABE9989, ABH0010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC099889, ABF00010-ABF0989, ABF00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide SEQ ID NO 214280 for detecting SNP TSC0052120.

                                                                                                                                                                                                                                                                                             This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligoners for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99889, ABF00010-ABE99889, ABF00010-ABE99889 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at the printed specification, but tho wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory,
                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WFPO at five.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       typing, i
cytosine
                                           Set of oligonuclectides, useful for diagnosis and cell typing, idesigned to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide SEQ ID NO 132395 for detecting SNP TSC0033027.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
